

INSTALLATION TIPS FOR 3D DURASTONE™ PORCELAIN TILES

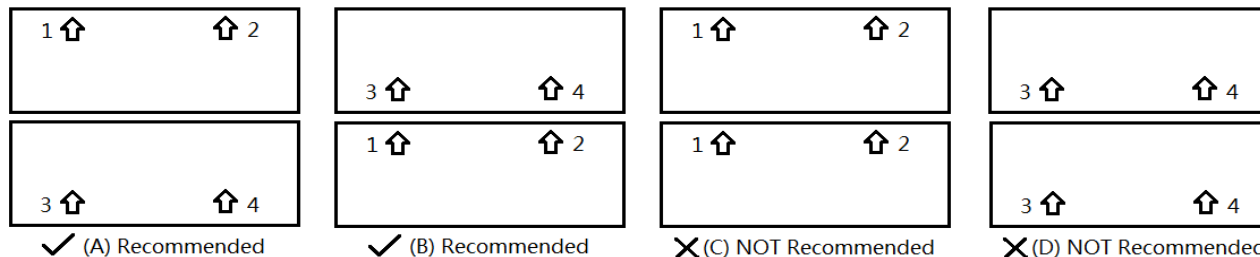

Due to the varying surface depth of the 3D tile and the extremely high temperature reached during the kiln firing process, unpredictable shrinkage in tile body is unavoidable. This causes strong movement on each tile body.

To achieve the best pattern alignment and consistency, the deviation and movement from point to point between 2 adjacent tiles has been controlled and sorted under a dedicated quality program during production. This process ensures all 3D tiles comply with ASTM C499 or ISO 13006 standards, in relation to dimensions and surface quality for natural and uneven surface finish tile.

For the best performance and result, we strongly recommend following the tips in below during installation:

- All tiles to follow the same direction indicated by the numbered arrows stamped on the back of each tile as A & B below.

- The grout joint width is recommended to be a minimum of 3mm.

Please contact Everstone's sales office or your local authorised distributor for further assistance.
